ABSTRACT

Background and Objectives: The Bayelsa Health Insurance Scheme (BHIS) is a state-designed social security plan in which enrollees benefit from a shared pool of cash based on premiums paid by participants. The study aimed to assess the self-reported effectiveness, service utilization, level of satisfaction, and barriers among beneficiaries, and proffer solutions to improve the scheme.

Methods: The study was a descriptive cross-sectional survey using a structured questionnaire. This questionnaire assesses the BHIS impact in Kolokuma/Opokuma LGA through six sections capturing demographics, service utilization, satisfaction, financial implications, access barriers, and improvement solutions using standardized scales and matrices, preceded by informed consent. Data was analyzed using SPSS and Microsoft Excel.

Results: The major barriers to service utilization were constant unavailability of claimed services at accredited facilities (90.1%) excessive waiting time (76.4%), late/non-referral to specialized centers (67.5), rigid BHIS protocols (63.1%), insufficient insurance coverage (55.2%), complex billing systems (50.7%), and shortage of BHIS staff (50.0%).

Conclusions: Possible solutions include the training and retraining of staff and service providers, providing subsidies for couples who are both government employees, initiating adequate supervision, monitoring, and feedback mechanisms, rapid referral protocols, and integrating and encouraging the establishment of health equity funds.

Key words: Patient satisfaction, health care costs, quality of health care, rural health services, vulnerable populations

INTRODUCTION

Health insurance, sometimes known as medical insurance, is a type of insurance that covers all or some of a person's medical expenses. As with other types of insurance, risk is shared by a large number of persons. The scheme is usually superintended by a

central institution, such as a government agency, commercial enterprise, or not-for-profit organization. [1]

Bayelsa is a state in Nigeria's South-South region, situated in the heart of the Niger Delta. It is one of the federation's newest states. [2,3] The state has eight local governments, [4] all of which are plagued by annual flooding; however, five are especially vulnerable. [5] Also, potentially carcinogenic soil pollution arising from the unlawful crude oil refining puts the populace at risk of a variety of ailments, including lung cancer, skin irritation, allergies, respiratory tract infections, and vision problems. [6,7] The situation is compounded by the poor state of primary health care infrastructure and personnel, resulting in the prevalence of communicable and noncommunicable diseases. Also, the state has a relatively high poverty index, with more than 60% of the population at risk of poverty, thereby limiting access to affordable and quality health care. [8,9]

The Bayelsa Health Insurance Scheme (BHIS) is a state government-designed social security plan with the mission to make medical care available to all residents in the state, irrespective of social and economic class, through fair and equitable financing of healthcare costs. [10] The BHIS services are provided at primary, secondary, and tertiary healthcare levels through a formal referral system. Benefits of the scheme include out-patient care, with necessary consumables, pharmaceutical care, diagnostic tests, consultation with specialists in the various fields of medicine, hospital care in a standard ward for a stay limited to a cumulative 30 days per year, eye examination, low-cost spectacles, dental care, a range of prosthesis, as well as promotional and preventative care such as immunization, health, and family planning education. [10] The study aims to assess the self-reported effectiveness of the State BHIS, the extent of out-of-pocket spending for healthcare services utilization before and after enrollment, the level of satisfaction of beneficiaries, barriers beneficiaries face when accessing BHIS, and offer solutions that will enhance the services of BHIS.

MATERIALS AND METHODS

Study design and setting

The study was a descriptive cross-sectional survey using a structured questionnaire to extract information from beneficiaries and a physical "on-the-spot" assessment of accredited health facilities under the BHIS. The research setting was the Kolokuma/Opokuma LGA of Bayelsa State, with headquarters in the town of Kaiama. It has an area of 361 km² with a population of 77,292 according to the 2006 census. [11] Bayelsa State is host to one of Nigeria's major crude oil and natural gas reserves, but despite its abundance of natural resources, the State receives very little benefits from its oil wealth due to structural disparities in the national revenue allotment system under the country's fiscal federalism. [4] The study was conducted between January 2023 and April 2025.

Study population

The study population consisted of all persons enrolled under the BHIS from Kolokuma/Opokuma Local Government Area

in Bayelsa State, Nigeria. The 2006 National Population Census of the local government area was used to estimate the study population. It is estimated that at least 3,000 persons are enrolled under the BHIS from the Kolokuma/Opokuma Local Government Area. All registered beneficiaries of the BHIS in Kolokuma/Opokuma LGA were included in the study.

Sample size determination and technique

Taro Yameni's population sample size formula was used to compute the sample size for the study. A sample size of 400 was obtained. A simple random sampling technique was applied to select registered BHIS beneficiaries from the Kolokuma/Opokuma LGA population frame, with 520 questionnaires distributed to account for an estimated 30% attrition/non-response rate.

Data collection instrument and sampling technique

A 78-item structured questionnaire was used in the study, including sections A to F. Response options included checklists, Likert scales, and open-ended fields. Section A captures socio-demographic and enrollment details, including gender, age, occupation, education, BHIS enrollment date, status, and current drug therapies. Section B evaluates utilization of 24 BHIS-covered services (e.g., outpatient care, pharmaceuticals, diagnostics, maternity services) and rates the overall scheme status in the LGA. Section C measures satisfaction levels across 12 BHIS services using a 4-point Likert scale. Section D assesses perceived impacts on healthcare utilization and out-of-pocket spending through five statements rated on a 5-point agreement scale. Section E identifies barriers to accessing BHIS services across 26 potential issues (e.g., service shortages, staff absenteeism, distance, stigma) via yes/no/unsure responses. Section F prioritizes 15 improvement solutions (e.g., staff training, subsidies for vulnerable groups, community advocacy, referral protocols) using a 5-point agreement scale and includes open-ended suggestions. The instrument features informed consent documentation, structured matrices for efficient data capture, and balances subjective perceptions with objective metrics, requiring under 20 minutes for completion. The questionnaire was designed as a Google Form and sent to the social media handles of enrollees, such as WhatsApp, Telegram, Facebook Messenger, etc. Also, a face-to-face mode was adopted for enrollees who were easily accessible. A convenience sampling technique was utilized.

Ethical considerations

Ethical approval was obtained from the Research and Ethics Committee, Ministry of Health, Bayelsa State, with approval number: BSHREC/Vol.1/24/02/13. Institutional approval was obtained from the BHIS head office. Consent to participate was obtained from enrollees who indicated a willingness to participate in the study by signing a written informed consent form.

Data analysis

Data obtained from the survey were analyzed using GraphPad InStat Version 27. Continuous data were expressed

as mean \pm SD, while categorical data were expressed as frequency and percentages. Pearson's Correlation analysis of BHS perceived barriers, service utilization, and level of satisfaction. BHIS service utilization was measured via beneficiaries' self-reported checklist responses confirming their use of covered services. BHIS satisfaction level captured beneficiary-rated experiences across services, while out-of-pocket spending reduction indicated perceived financial protection based on self-reported expenditure changes. Access barriers included documented obstacles like staff shortages or travel distance to facilities. Solution prioritization evaluated support for interventions such as subsidies for vulnerable groups or staff training. Finally, the BHIS status rating assessed the scheme's overall functionality within the local government area through beneficiary feedback.

RESULTS

Socio-demographic characteristics of respondents

A total of 520 questionnaires were distributed, but 406 were retrieved, giving a response rate of 78.1%. The modal age group was age 35 to 44 years, while the youngest age group was those between 18 and 25 years. More than one quarter, 33.5%, had four children. More than half, 56.2%, had a tertiary education, and 20.0% indicated they drink alcohol, while 11.6% were smokers (Table 1).

More participants were enrolled in the year 2019 (35%), while only 5.2% of respondents were enrolled in 2022. More than half of enrollees, 50.7%, were on antimalarial medications, while arthritis was the least common condition observed (13.8%). Out of 406 participants, a majority had active BHIS status (92.4%), while only 7.6% (31) were inactive (Figure 1).

Scope of coverage and level of satisfaction with BHIS services

The level of coverage for outpatient care, pharmaceutical care service, and preventive immunization was 63.3%, 50.7%, and 50.7%, respectively. Nearly half of the participants (47.4%) were dissatisfied with the services provided by BHIS, while 23.9% indicated a moderate level of satisfaction (Tables 2 and 3).

Level of satisfaction from BHIS

Barriers faced in accessing BHIS services

Constant unavailability of claimed services at accredited facilities was the highest barrier faced by enrollees (90.1%), followed by excessive waiting time at service centers (76.4%) and late/non-referral to specialized centers (67.5%; Table 4).

The extent of out-of-pocket spending for healthcare service utilization

More than half, 57.6 %, did not agree with the statement that enrolling in the BHIS reduced their level of out-of-pocket health expenditure, and 65.5 % stated that BHIS services

More than half of the respondents (54.2%) indicated that the current state of the BHIS services at the Kolokuma/Opokuma LGA requires urgent intervention by the state government (Figure 2).

The Pearson correlation analysis of the perceived barriers, healthcare utilization, and level of service satisfaction of BHIS among the participants (Table 7).

DISCUSSION

Demographics

Both qualitative and quantitative methods were used to assess the effectiveness of the BHIS. The modal age group was 33 to 44 years. This is similar to the age distribution observed in a study carried out by Akinyemi et al. [12], where the predominant age group was between 31 and 40 years of age.

More than half of the participants were married. A similar predominance of married enrollees was observed in studies conducted in Nigeria [13] and Ghana. [14] The level of participation in the scheme is comparatively low but varied from year to year, with a peak in 2017. This agrees with the observation that in developing countries, health insurance enrollment rates are quite low. [15,16] Lengthy registration process, a lack of funds, a low level of knowledge, and the availability of alternative sources of treatment were some reasons cited by respondents for non-utilization in the scheme. Among other factors, participants' perception and

affordability have also been identified by other workers as barriers to involvement in health insurance. [17–19]

Current state, level of satisfaction, and healthcare utilization

A majority of the participants believed that the current state of the BHIS services was deplorable and there was a need for government intervention to put it back on track. Only 35.0% agreed that BHIS services have improved their level of healthcare service utilization. This is in contrast with a meta-analysis of studies conducted in sub-Saharan Africa, which showed that 61.84% of beneficiaries were satisfied with their health insurance (95% CI, 55.14–68.55).

Availability of prescribed drugs and laboratory services is significantly associated with higher levels of patient satisfaction. [20] The level of satisfaction is very low in our study, which is understandable since these crucial indices are lacking, and most centers in the study area witnessed constant nonavailability of claimed benefits. Overall, only 4.0% and 12.5% were highly and moderately satisfied with the services provided by the scheme. This is consistent with a recent survey in which beneficiaries of the NHIS were fairly satisfied with the scheme. They considered it an improvement to being uninsured, but believe that the plan can be significantly improved. [21]

Perceived barriers faced by BHIS enrollees

Constant unavailability of claimed services, excessive waiting time, late/non-referral to specialized centers, rigid

BHIS protocols, limited consultation time, and insufficient insurance coverage for all medical needs were some of the perceived barriers faced by BHIS enrollees in trying to access the services in designated health facilities.. A similar spectrum of challenges was noted in an Italian study. [22]

Possible solutions to the challenges faced with the BHIS services

Possible solutions suggested by participants included training and retraining of staff and service providers, provision of subsidies for couples who are both government employees, rapid referral protocols for all service centers, and integration of outreach services into the health insurance scheme. These suggestions are similar to those proposed in previous studies; shorter waiting times and a more comprehensive research exploring factors enhancing better patient satisfaction were essential in improving the overall satisfaction with the scheme. [21]

Others have suggested state subsidisation of healthcare costs and public enlightenment, emphasizing perceived benefits of the scheme as well as easing access and enrollment protocols.

[23] Also, motivating and retaining healthcare workers, adopting appropriate technology, and clarifying prepayment mechanisms have been proposed as possible solutions. [24] Adopting and implementing policies that will enhance the health literacy of potential beneficiaries of the scheme has also been suggested. [25]

The perceived barriers with the highest number of responses (positive and negative) were pooled together, and a correlational analysis was performed. The Pearson correlation (r) showed -0.595 , indicating an insignificant association. A Pearson correlation (r) value of 0.10 indicates a small association, 0.30 indicates a medium association, and 0.50 indicates a large or significant association. The same association was observed between the healthcare service utilization and level of satisfaction from BHIS services, with Pearson correlation (r) values of -1.000 and -0.829 , respectively. This indicates a low statistical correlation among the responses obtained (**Table 7**).

The study was able to assess the impacts of the BHIS in the Kolokuma/Opokuma LGA of Bayelsa State, and vital measures

Table 7: Association among perceived barriers, level of satisfaction, and service utilization.

on how to mitigate the challenges faced by enrollees were suggested, but these findings are limited to only one LGA out of 8 LGAs in Bayelsa State. Another limitation of the study is possible social desirability bias in self-reported services or responses, and the cross-sectional design to contextualize the findings. Therefore, further studies should be conducted with wider LGA or inter-state coverage to validate the outcomes of the study for onward policy-making decisions.

CONCLUSIONS

Enrollees of the BHIS at the Kolokuma/Opokuma LGA were dissatisfied with the services due to barriers faced including constant unavailable of claimed services at accredited facilities, excessive waiting time, late/non-referral to specialized centers, rigid protocols, limited consultation time, insufficient insurance coverage for all medical needs, complex

billing systems, shortage of staff, poor patient-provider relationship, staff constant absenteeism, lack of holistic therapeutic approach, distance to service centers from home, and untrained staff. These barriers could be overcome by training and retraining service providers, providing subsidies for couples who are both government employees initiating adequate monitoring and feedback mechanisms, rapid referral protocols for all service centers, health equity fund establishment and avoidance of complex billing, advocacy, and counseling on consumer information, advocacy on community participation and intervention, social marketing of services, broaden the coverage based endemic diseases, and religious and cultural sensitization on healthcare delivery. Based on the findings, the government should enhance the BHIS by training staff and improving supervision of service centers. Also, advocacy and community engagement on consumer information and participation, cultural and religious sensitization, broadening disease coverage, and conducting further multi-LGA studies across Bayelsa State are recommended to strengthen the scheme.

AUTHORS' CONTRIBUTION

Each author has made a substantial contribution to the present work in one or more areas, including conception, study design, conduct, data collection, analysis, and interpretation. All authors have given final approval of the version to be published, agreed on the journal to which the article has been submitted, and agree to be accountable for all aspects of the work.
